

**Willem's question for COSC410 assignment 02** (worth 2 marks out of 10):

Let  $L$  be a first-order language with  $\text{Pred} = \{(P, 1)\}$  and let  $(D, \text{den})$  be an interpretation of  $L$  with  $D = \{1, 2, 3\}$  and  $\text{den}(P, 1) = \{2\}$ .

Suppose  $v: \text{Var} \rightarrow D$  is the variable assignment given by  $v(x_j) = 1$  for all  $j$ .

Show that  $v$  satisfies  $\exists x_1 P(x_1)$  in  $(D, \text{den})$ . Give details of your argument, and make use of the definition of satisfaction.

**Solution**

To show that  $v$  satisfies  $\exists x_1 P(x_1)$  in  $(D, \text{den})$ , it is enough to show that we can find some  $d \in D$  such that the variable assignment  $v[x_1 \rightarrow d]$  satisfies  $P(x_1)$ .

For a variable assignment  $v[x_1 \rightarrow d]$  to satisfy  $P(x_1)$ , the denotation of  $x_1$  has to be in  $\text{den}(P, 1) = \{2\}$ . But what is the denotation of  $x_1$  when we have a variable assignment of the form  $v[x_1 \rightarrow d]$ ?

Well,  $v[x_1 \rightarrow d]$  is just the name of a function, namely the function that behaves exactly like  $v$  except for sending input  $x_1$  to output  $d$ . To get the denotation of  $x_1$  we apply the function to input  $x_1$  and see what the output is. The output is

$$v[x_1 \rightarrow d](x_1) = d$$

because the name of the function tells you it's going to spit out  $d$  when fed  $x_1$ .

So, for  $v[x_1 \rightarrow d]$  to satisfy  $P(x_1)$  we want  $d$  to be in  $\text{den}(P, 1) = \{2\}$ .

Choose  $d = 2$ . Then  $v[x_1 \rightarrow 2]$  satisfies  $P(x_1)$  since

$$v[x_1 \rightarrow 2](x_1) = 2 \in \{2\} = \text{den}(P, 1).$$

Since there does exist some  $d$  in  $D$ , namely  $d=2$ , such that  $v[x_1 \rightarrow d]$  satisfies  $P(x_1)$ , we may conclude that  $v$  itself satisfies  $\exists x_1 P(x_1)$  in  $(D, \text{den})$ .
