COSC421: Neural Models of Language Lecture 5: Working memory for episodes and phonological material

Alistair Knott

Dept. of Computer Science, University of Otago

In Lectures 1–3, I introduced a model of the SM processes involved in 'experiencing' an agent grabbing a cup.

In Lecture 4, I argued:

- *Perception* of a reach-to-grasp action involves a sequence of three sensorimotor operations.
- *Execution* of a reach-to-grasp action involves a very similar sequence.

< 回 > < 回 > < 回 > -

Operation 1 *O* attends to an external agent, configuring his mirror system circuit for action perception.

Operation 1	<i>O</i> attends to an external agent, configuring his mirror system circuit for action perception.
State 1	<i>O</i> receives reafferent feedback from this operation; the percept 'man'.

Operation 1	<i>O</i> attends to an external agent, configuring his mirror system circuit for action perception.
State 1	O receives reafferent feedback from this operation; the percept 'man'.
Operation 2	O establishes joint attention with the agent, and at- tends to another object (the cup).

Operation 1	<i>O</i> attends to an external agent, configuring his mirror system circuit for action perception.
State 1	<i>O</i> receives reafferent feedback from this operation; the percept 'man'.
Operation 2	<i>O</i> establishes joint attention with the agent, and attends to another object (the cup).
State 2	<i>O</i> receives feedback from this operation: the percept 'cup'.

Operation 1	O attends to an external agent, configuring his mirror
	system circuit for action perception.
State 1	O receives reafferent feedback from this operation;
	the percept 'man'.
Operation 2	O establishes joint attention with the agent, and at-
	tends to another object (the cup).
State 2	O receives feedback from this operation: the percept
	'cup'.
Operation 3	O initiates a process of biological motion classifica-
	tion, which results in the action 'grab' being activated
	in O's premotor cortex.

Representation of the cup-grabbing event in memory

In this lecture I'll talk about how a cup-grabbing event is represented in **working memory**.

I'll also discuss how *words* are held in working memory—which will be an introduction to linguistic representations in the brain.

Alistair Knott (Otago)

- Working memory (WM) and long-term memory (LTM)
- The different forms of WM: visuospatial, phonological and semantic
- A simple model of phonological WM by Burgess and Hitch (1999)
- Semantic WM representations
 - Baddeley's episodic buffer
 - Representations of planned action sequences in WM

There is a well-established distinction between working memory (WM) and long-term memory (LTM) in psychology.

The basic idea:

• WM involves frontal cortex and the temporoparietal junction.

There is a well-established distinction between working memory (WM) and long-term memory (LTM) in psychology.

The basic idea:

- WM involves **frontal cortex** and the temporoparietal junction.
- LTM involves the hippocampus, and adjacent regions of temporal cortex.

Neuropsychology.

- Patients with damage to the hippocampus (& associated cortical areas) show impaired LTM with normal WM.
 Patient HM had his hippocampal region removed bilaterally.
 - He had anterograde amnesia: couldn't form new memories.
 - But he could still carry on a conversation, play chess, repeat phone numbers.
- Patients with damage to the frontal lobes (sometimes) have the reverse pattern.

Patient **KF** (Shallice and Warrington, 1970) had damage to his left temporoparietal cortex.

- He had very bad phonological STM. (E.g. a digit span of 1.)
- But his ability to store events in LTM was intact.

・ロ・ ・ 四・ ・ ヨ・ ・ ヨ・ ・

Behavioural experiments on normal subjects.

A classic WM task: immediate serial recall (ISR) of a list of stimuli.

There's good evidence subjects encode stimuli in ISR experiments *phonologically*—i.e. as sounds, rather than as meanings.

- Phonological similarity effects: ba ga da is harder than bo ga di
- Word length effects: *kitten collie rooster* is harder than *cat dog chick*

In LTM experiments, stimuli are encoded as meanings, not sounds.

- cat is not confused with bat
- cat is confused with kitten

э

・ロト ・ 四ト ・ ヨト ・ ヨト …

Neural mechanisms.

WM is implemented in two ways.

- 1. The activity levels of cells.
 - To store a pattern of activation in a group of neurons, you *keep it active*.
- 2. Short-term synaptic connections between neurons. (Connections that fade over 10/20 seconds.)
 - To store a pattern of activation in a group of neurons, you strengthen the synaptic connections between these neurons.

LTM is implemented in 'long-term' synaptic connections between neurons.

く 同 ト く ヨ ト く ヨ ト -

Summary:

	WM	LTM
Duration	seconds/minutes	days/years
Stored in	frontal cortex/TPJ	hippocampus (\rightarrow cortex)
Represented as	sounds &	meanings
Implemented as	neural activity /	long-term
	short-term synaptic	synaptic connection
	connection strengths	strengths

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >
Episodic and semantic LTM

There are actually two forms of LTM.

Episodic memory: memory for specific episodes in an agent's life.

• E.g. 'Yesterday, John grabbed this cup here'.

Semantic memory: memory for generic facts.

• E.g. 'Cups tend to have handles'.

I'll focus on episodic memory, because that's how a (single) cup-grabbing event would be represented.

(There's also **procedural memory**, which is LTM for *skills*. A lot of learning in the motor system is of this type.)

Definitions of 'working memory'

The best known model of WM: Baddeley and Hitch (1974) (updated by Baddeley, 2000).

Baddeley's definition of WM: a short-term store which subserves 'cognitive' operations: language processing, reasoning, learning.

The term 'working memory' is also used in sensorimotor psychology, to refer to an animal's **prepared actions** or **task set**.

Baddeley wants to keep these two senses of WM separate. I'll look at both types of WM.

æ

・ロ・・ (日・・ モ・・ ・ 日・・

The visuospatial sketchpad: a working memory for visual patterns.

- E.g. remembering a shape, so you can recognise it later. (Probably involves IT and its interface with PFC)
- E.g. remembering where you saw something. (We won't be looking at this.)
- Patterns can be spatially complex, but not temporally complex.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

The phonological loop: holds a short sequence of **words or phonemes**.

- Items in the phonological loop are stored as *sounds*.
 - Phonological similarity / word length effects (already mentioned)
- Phonological sequences need to be *rehearsed* to be retained, as shown by studies of **articulatory suppression**.

- It's harder to recall a phon. sequence if you have to say *the the the* during the delay period. (Try it...)

・ロン ・四 ・ ・ ヨン ・ ヨン

The episodic buffer: a special form of storage for 'episodes'.

- 1. This form of storage is **semantic**. Some evidence for it:
 - Sentences are easier to recall than sequences of unrelated words (Baddeley *et al.*, 1987).
 - Amnesic patients can retain the 'gist' of a paragraph of around 15 propositions for a short period (Wilson & Baddeley, 1988).
 - Amnesic patients can reason, solve problems, play bridge...

2. The episodic buffer can interface with the phonological loop.

- A simple example: chunking.
 - Four two-syllable words are easier to recall than eight one-syllable words (Hulme *et al.*, 1991)
 - Model: the phonological buffer stores a sequence of **pointers** to semantic items held 'in a separate WM buffer'.
- Baddeley: our improved WM for sentences / paragraph gist is due to items held in this same buffer.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

3. The episodic buffer holds representations which integrate **sensory**, **semantic** and **phonological** information, and which are maintained through rehearsal.

Baddeley and Andrade (2000): subjects shown stimuli varying in meaningfulness (high/low) and in modality (visual/phonological) and asked to rate their 'vividness' after an interim distractor task.

- Meaningful stimuli were rated as more vivid.
- There was a modality-specific effect of distractor task on rated vividness, which didn't interact with meaningfulness.

< 回 > < 回 > < 回 >

3. The episodic buffer holds representations which integrate **sensory**, **semantic** and **phonological** information, and which are maintained through rehearsal.

- Low/high meaning visual stimuli ((jumbled) photos)
 - Visual distractor task: shapes lose vividness
 - Phonological distractor task: shapes retain vividness
- Low/high meaning phonological stimuli ((scrambled) sentences)
 - Visual distractor task: tones retain vividness
 - Phonological distractor task: tones lose vividness

イロト イポト イヨト イヨト

3. The episodic buffer holds representations which integrate **sensory**, **semantic** and **phonological** information, and which are maintained through rehearsal.

- There must be a WM medium where we represent stimuli *semantically*. (Because meaning affects vividness.)
- The medium must be maintained through rehearsal. (Because distractor tasks affect storage.)
- The medium must interface with phonological/visual modalities. (Because distractor effects are modality specific.)

4. The episodic buffer plays a role in the storage of **episodic memories**.

- Experienced episodes are initially stored in the episodic buffer.
- From there they are relayed to longer-term storage.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

5. Material in the episodic buffer is rehearsed by a process of 'sequential attention'.

- Rehearsal in the phonological buffer involves 'producing' each item in the sequence.
- There must be a way in which items in the episodic buffer are sequentially 'produced'.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

6. The episodic buffer is probably implemented in a network involving **frontal cortex**.

fMRI study by Prabhakaran et al. (2000):

- A task requiring retention of integrated verbal and spatial information activates a right frontal area.
- More posterior areas are activated by tasks requiring retention of unintegrated material.

• There are good models of phonological WM.

Burgess and Hitch (1999) proposed a model of phonological working memory. This model is what you're looking at in Assignment 1. Here's a simplified version:

A (10) A (10) A (10)

The context units are hardwired to step through a sequence of patterns, as shown here:

Note: context representations use **population coding**. (Successive contexts are represented by overlapping patterns.)

Here's how it works.

We present the first digit, in the first context.

We evoke a pattern of activity in the 'item' units.

Competition in the **item** units sharpens this pattern, so there's a clear winner.

We strengthen associations between all active units. (Now the winning **item** unit maps the current context onto the current digit.)

Then we *inbibit* the winning **item** unit, and move to the next context.

WM representations of prepared actions

Behavioural psychologists often use the term WM to refer to the place where an animal holds its **current task set**.

- In many circumstances, an animal maintains a set of prepared actions, or a set of prepared responses to stimuli.
- These are assumed to be held in 'working memory'.

Recall from Lecture 3: Task set and action preparation involve PFC.

- PFC imposes top-down biases on attentional operations
- PFC imposes top-down biases on motor actions.

Evidence includes the Wisconsin card-sorting task, the Stroop task...

Here's a well-known model of how PFC implements cognitive set, by Miller and Cohen (2001).

- There are many different pathways from stimuli to motor responses. (Visual-parietal-premotor-motor cortices.)
- Intermediate units in these pathways compete with one another.
- PFC units can bias this competition towards one pathway or another.

・ロン ・四 ・ ・ ヨン ・ ヨン

Here's a well-known model of how PFC implements cognitive set, by Miller and Cohen (2001).

If the PFC1 assembly is active, this biases the agent towards responding to S1 with R1.

Here's a well-known model of how PFC implements cognitive set, by Miller and Cohen (2001).

If the PFC2 assembly is active, this biases the agent towards responding to S1 with R2.

Here's a well-known model of how PFC implements cognitive set, by Miller and Cohen (2001).

If the PFC2 assembly is active, this biases the agent towards responding to S1 with R2.

• Since pathway units compete with each other, either bias makes the agent tend to *ignore* S2.

WM representations of prepared action sequences

Recall: our cup-grabbing action is actually a *sequence* of actions. How can an agent prepare a sequence?

There is good evidence that PFC is involved in planning action sequences.

- Lesion studies in monkeys (e.g. Petrides, 1991) and humans (Petrides and Milner, 1982)
- PFC cells in monkeys sensitive to specific prepared sequences (e.g. Barone and Joseph, 1989)

An influential model of sequence preparation in PFC is called **competitive queueing** (see Grossberg, 1978; Houghton, 1995; Rhodes *et al.*, 2004).

・ロト ・四ト ・ヨト・

Competitive queueing

Each action is represented at a **planning level** and a **competitive level**.

- A sequence plan is a gradient of activation in the planning level.
- This gradient is passed to the competitive level, where the most active action is selected and executed.
- The winning action inhibits its counterpart in the planning level, and the next-most-active action is the next to win. (And so on.)

Alistair Knott (Otago)

Competitive queueing

There is good evidence for competitive queueing.

- It provides a good account of reversal errors, where the order of two successive actions is swapped.
- Averbeck *et al.*, 2002 found PFC cells that behave exactly like actions in the planning level.

Averbeck et al.'s experiment

Averbeck *et al.* (2002) trained monkeys to draw a number of different shapes in response to cue stimuli.

- Drawing each shape involved a sequence of motor movements.
- After the cue appeared, there was a delay before the monkey could begin to draw.

PFC cells were recorded during the wait and drawing periods.

A (10) A (10) A (10)

Averbeck et al.'s experiment

Different PFC cells were sensitive to different movements.

- Note: the *activity level* of cells during the delay period encodes the *order* in which movements will occur.
- That's exactly what competitive queueing predicts.

< □ > < □ > < □ > < □ > < □ >

Extensions to competitive queueing

CQ models cannot deal with **repeated actions** (e.g. A1, A1, A2).

• To allow repeated actions, CQ models are often augmented with an extra **context signal**, which evolves independently in time (see e.g. Burgess and Hitch, 1999).
Extensions to competitive queueing

CQ models cannot deal with **repeated sequences**, since plans are destructively updated as a plan is executed.

- To fix this, we can introduce a **tonically active** version of the planned sequence, which can restore the planning level pattern.
- Averbeck and Lee (2007) find cells in PFC which encode a planned sequence in the intervals between repeated executions.

Varieties of context signal

The context signal described above evolves as a function of time. But some actions take an unpredictable amount of time.

Another model of sequence preparation is based on Miller and Cohen's pathway-biasing model of PFC.

- Assume some stimuli are reafferent consequences of the agent's own actions.
- Biasing pathways from these stimuli to other actions effectively prepares action sequences.

★ ∃ > < ∃ >

Executing a planned action sequence: summary

It is likely that planned sequences involve a mixture of CQ and pathway-biasing mechanisms.

In either case, when an agent is executing a planned sequence:

- There will be a **sustained signal**, representing all the actions in the selected plan simultaneously.
- There will be a sequence of **transient signals**, interleaving actions and their reafferent consequences.

Action1-then-Action2 plan	Action1
\downarrow	SensoryConsequence
\downarrow	Action2
\downarrow	SensoryConsequence

A B F A B F

Replaying PFC plans: simulation mode

There is some evidence that agents can 'internally replay' stored sensorimotor sequences.

• This comes from work on **place cells** in the hippocampus.

Imagine a **simulation mode**, in which a prepared SM sequence can be internally replayed, with no external effects.

Simulation is easy in a competitive queueing model.

 If you execute a prepared action sequence, each winning action activates an action in the motor cortex.

< ロ > < 同 > < 回 > < 回 >

Simulation is easy in a competitive queueing model.

- If you **execute** a prepared action sequence, each winning action activates an action in the motor cortex.
- If you simulate a prepared action sequence, you just need to switch off the links to the motor cortex.

< ロ > < 同 > < 回 > < 回 >

In an associative chaining model, simulation is a bit more tricky.

We have to switch off links to overt actions (as for CQ).

- We must also find a way for a simulated action to trigger its *own* reafferent consequence.

In an associative chaining model, simulation is a bit more tricky.

- We have to switch off links to overt actions (as for CQ).
- We must also find a way for a simulated action to trigger its *own* reafferent consequence.

There are ways this could be done, both for motor actions and for attentional actions.

Alistair Knott (Otago)

The episodic buffer revisited

A stored sensorimotor sequence plan which supports internal replay sounds a lot like Baddeley's episodic buffer.

- It accesses representations in several SM modalities
- It has the form of a sequence, which can be 'rehearsed'
- It buffers observed actions as well as executed actions
- It is implemented in frontal areas.

Proposal: episodes are stored in WM as prepared SM sequences.

A (10) A (10)

Summary

- An event is *experienced* as a *SM sequence*.
- It is stored in *working memory* (in PFC) as a *planned SM* sequence.
- PFC storage probably involves a mixture of competitive queueing, context-based and associative chaining mechanisms.
- The planned SM sequence can be internally replayed.

I will argue that generating a sentence reporting a given episode involves replaying a planned SM sequence in working memory, in a special mode where SM signals can activate phonological signals.

Replaying a grasp episode: timecourse of SM signals

Sustained PFC signal	Transient signals		
	Context signals	Action signals	Reafferent signals
plan _{attend_} agent/attend_cup/grasp	<i>C</i> ₁		
↓ ↓		attend_agent	
\downarrow			attending_to_agent
plan _{attend_agent} /attend_cup/grasp	C ₂		
\downarrow		attend_cup	
↓ ↓			attending_to_cup
plan _{attend_agent/attend_cup/grasp}	<i>C</i> ₃		
\downarrow		grasp	
\downarrow			attending_to_agent
<i>plan_{attend_}agent/attend_cup/grasp</i>
