• We experience the world through SM routines with well-defined *sequential structure*.

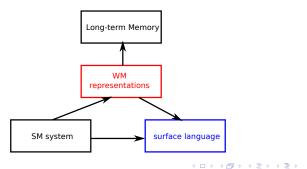

э

- We experience the world through SM routines with well-defined *sequential structure*.
- This sequential structure is retained in WM representations of episodes and individuals...

- We experience the world through SM routines with well-defined sequential structure.
- This sequential structure is retained in WM representations of episodes and individuals...
- And also in the syntactic structure of sentences.

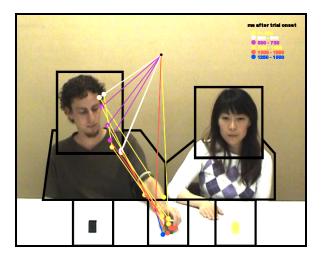

• We experience the world through SM routines with well-defined *sequential structure*.

э

・ロ・・ (日・・ モ・・ ・ 日・・

Example: the SM routine for perceiving an episode

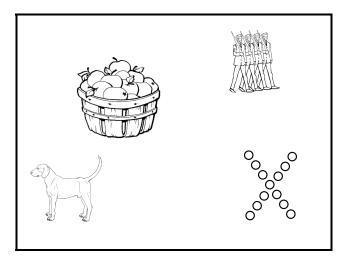

Webb, Knott and MacAskill, 'Eye movements during transitive action observation have sequential structure' Acta Psychologica 2010

Example: the SM routine for perceiving an episode

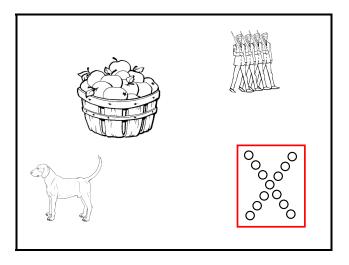

We argue: perceiving (or performing) a transitive action involves a canonical sequence of SM operations.

Step	SM operation
1	identify_agent
2	identify_patient
3	identify_action

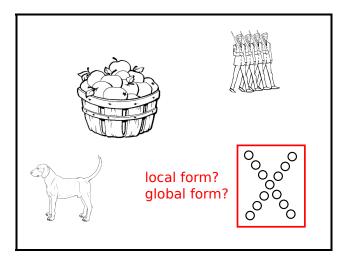

< 回 > < 三 > < 三 >

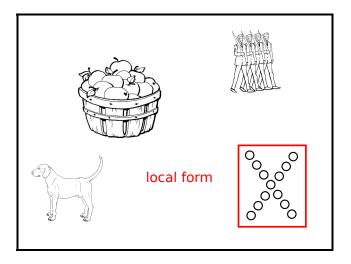

Alistair Knott, Martin Takac (Univ. Otago)

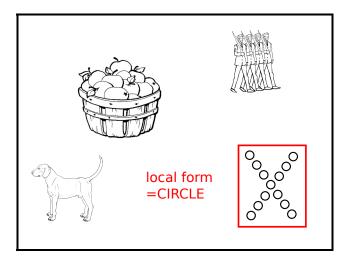

Alistair Knott, Martin Takac (Univ. Otago)

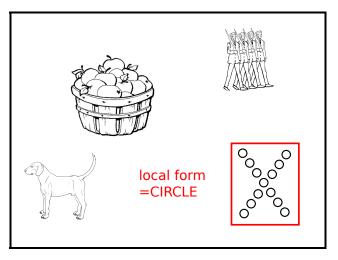

< ロ > < 同 > < 回 > < 回 >

< ロ > < 同 > < 回 > < 回 >

< ロ > < 同 > < 回 > < 回 >

Walles, Robins and Knott, 'A perceptually grounded model of the singular-plural distinction' Language and Cognition 2014

We argue: identifying an individual also involves a canonical sequence of SM operations.

Step	SM operation
1	attend_location
2	establish_scale (=identify singular or plural)
3	activate_class

A model of WM representations

How are episodes and individuals represented in WM?

Alistair Knott, Martin Takac (Univ. Otago)

イロト イヨト イヨト イヨト

A model of WM representations

How are episodes and individuals represented in WM?

Our proposal: they are stored as prepared SM routines.

Benefit 1: a road map

We know lots about how SM sequences are stored in WM.

イロト イヨト イヨト イヨト

Benefit 1: a road map

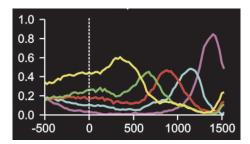

We know lots about how SM sequences are stored in WM.

• Prefrontal cortex is heavily involved.

Benefit 1: a road map

We know lots about how SM sequences are stored in WM.

- Prefrontal cortex is heavily involved.
- In the prefrontal assembly representing a planned sequence of actions, representations of the actions are active *in parallel*.

Averbeck et al., 'Parallel processing of serial movements in prefrontal cortex' PNAS 2002

A (10) + A (10) + A (10)

If experiences are stored as prepared SM routines, they're *executables*.

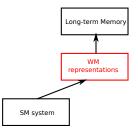

イロト イポト イヨト イヨト

If experiences are stored as prepared SM routines, they're *executables*.

• So there's a natural account of how we replay or simulate experiences.

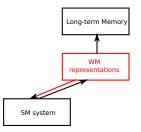

If experiences are stored as prepared SM routines, they're *executables*.

• So there's a natural account of how we replay or simulate experiences.

If experiences are stored as prepared SM routines, they're *executables*.

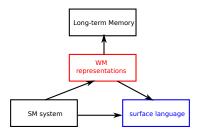

• So there's a natural account of how we replay or simulate experiences.

Benefit 3: support for a model of sentence generation

If experiences are stored as prepared SM routines, they're *executables*.

 Our idea: generating a sentence involves replaying an episode held in WM *in a special mode*, where SM signals trigger output words.

Takac, Benuskova and Knott, 'A connectionist model of language acquisition and sentence generation' Cognition 2012

< □ > < 同 > < 回 > < 回

Benefit 4: a new account of semantic role-binding

Alistair Knott, Martin Takac (Univ. Otago)

イロト イポト イヨト イヨト

Benefit 4: a new account of semantic role-binding

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

• This is hard to do in a neural network model!

Benefit 4: a new account of semantic role-binding

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.

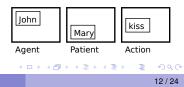

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.
- This is a bad idea...but it can be resurrected if episodes are structured as sequences.

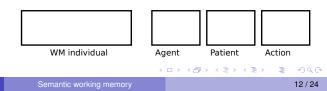

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

• This is hard to do in a neural network model!

Alistair Knott, Martin Takac (Univ. Otago)

- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

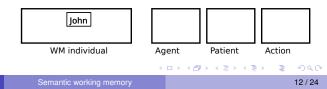

In our model, there's a (single) medium holding WM representations of individuals.

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

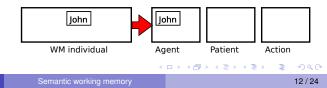

When perceiving an episode, we attend to the agent...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

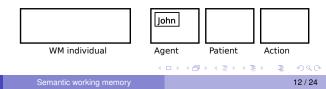

Then we copy this representation to the WM episode...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

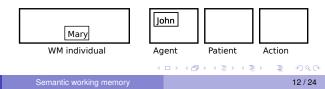

Then we copy this representation to the WM episode...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

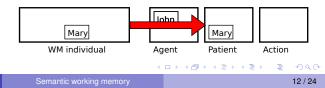

Then we attend to the patient...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

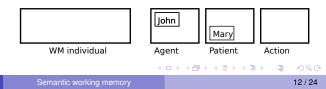

Then we copy this representation to the WM episode...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

Then we copy this representation to the WM episode...

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

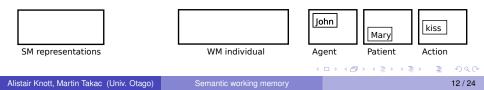

Then we identify the action, and copy that to the WM episode.

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

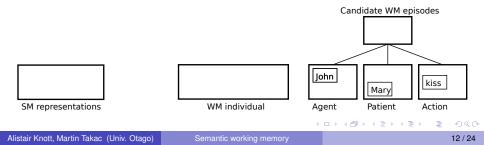

Then we identify the action, and copy that to the WM episode.

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

- This is hard to do in a neural network model!
- We can't just activate all concepts in the episode simultaneously.
- One old idea is to code semantic roles by place.

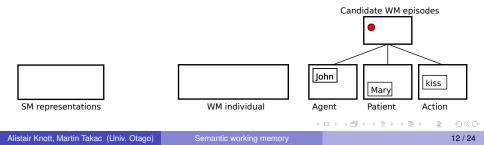

We can now have localist representations of whole episodes.

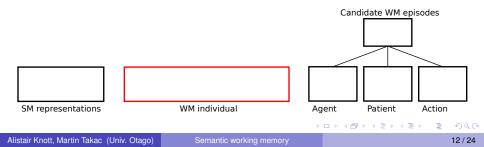

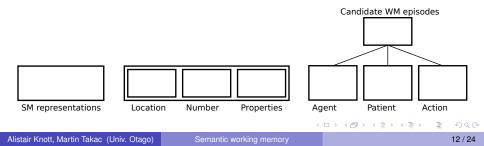

An episode representation has to identify the semantic role played by each of its participants (e.g. AGENT, PATIENT.)

Benefit 5: an account of nested semantic structures

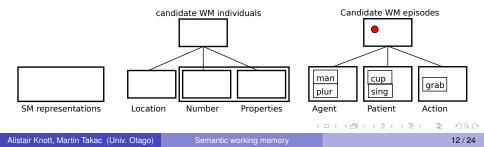

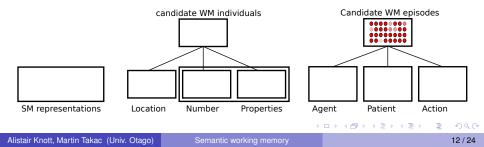

Benefit 5: an account of nested semantic structures

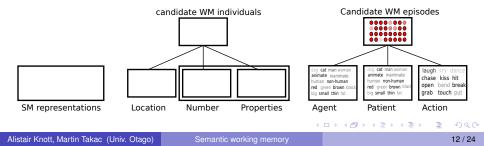

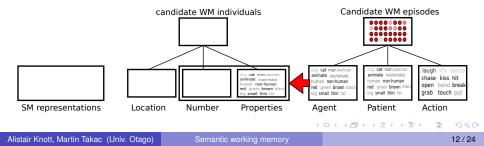

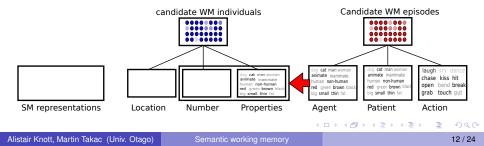

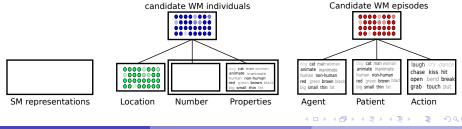

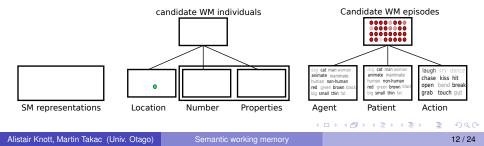

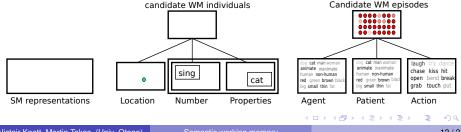

Alistair Knott, Martin Takac (Univ. Otago)

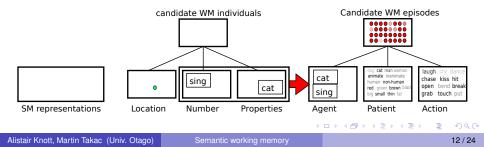

Semantic working memory

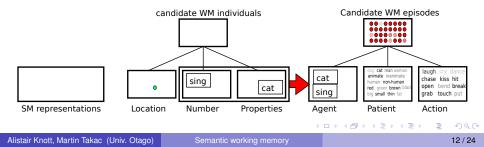

Alistair Knott, Martin Takac (Univ. Otago)

Semantic working memory

- Animate objects of 4 types (PERSON, DOG, CAT, BIRD)
- Things of 3 types (CUP, BALL, CHAIR).

- Animate objects of 4 types (PERSON, DOG, CAT, BIRD)
- Things of 3 types (CUP, BALL, CHAIR).

Individuals randomly generated—vary in **gender** and **colour** (R, G, B), placed at different **locations** (100x100 grid).

・ロト ・聞 ト ・ ヨ ト ・ ヨ トー

- Animate objects of 4 types (PERSON, DOG, CAT, BIRD)
- Things of 3 types (CUP, BALL, CHAIR).

Individuals randomly generated—vary in **gender** and **colour** (R, G, B), placed at different **locations** (100x100 grid).

100 permanent individuals, non-permanent individuals added with p=0.01 (can be forgotten).

- Animate objects of 4 types (PERSON, DOG, CAT, BIRD)
- Things of 3 types (CUP, BALL, CHAIR).

Individuals randomly generated—vary in **gender** and **colour** (R, G, B), placed at different **locations** (100x100 grid).

100 permanent individuals, non-permanent individuals added with p=0.01 (can be forgotten).

Individuals participate in episodes.

Episode

Episode types:

transitive agent→patient→trans-action (e.g. MAN CAT STROKE)

- intransitive agent→intrans-action (e.g. BIRD SING)
- $\begin{array}{c} \mbox{causative agent} \rightarrow \mbox{patient} \rightarrow \mbox{cause-signal} \rightarrow \mbox{causative-action (e.g.} \\ \mbox{MAN CUP CAUSE-TO-BREAK)} \end{array}$

Actions:

transitive 10 (GRAB, HIT, PUSH, SEE, HOLD, KICK, HUG, BITE, PAT, STROKE)

intransitive 8 (WALK, LIE, SNEEZE, SIT, SLEEP, RUN, SNORE, SING) causative 4 (CAUSE-TO-BREAK, CAUSE-TO-HIDE, CAUSE-TO-STOP, CAUSE-TO-GO)

3

Episode

Episode types:

transitive agent \rightarrow patient \rightarrow trans-action (e.g. MAN CAT STROKE)

```
intransitive agent→intrans-action (e.g. BIRD SING)
```

Actions:

transitive 10 (GRAB, HIT, PUSH, SEE, HOLD, KICK, HUG, BITE, PAT, STROKE)

intransitive 8 (WALK, LIE, SNEEZE, SIT, SLEEP, RUN, SNORE, SING) causative 4 (CAUSE-TO-BREAK, CAUSE-TO-HIDE, CAUSE-TO-STOP, CAUSE-TO-GO)

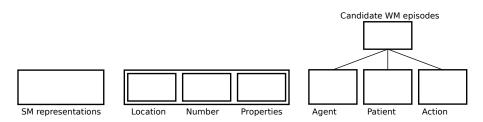

The model is exposed to a continuous stream of episodes (not a fixed training set).
